

INTRODUCING the NEW

MARINO CELL

Shallow stormwater management
in complex urban environments

Modular Stormwater Storage

Introducing the DeepRoot Marino Cell™: a shallow stormwater storage system specially crafted for urban environments. Its shallow depth (from 6" to 24"), modular design, high strength, and minimal cover requirements make it the perfect green solution for a variety of project applications, including:

- Bioretention
- Green Roofs
- Permeable Pavement
- New Tree Watering
- Micro Drainage

The 95% void space can be utilized for stormwater detention, infiltration, and harvesting. Installed just below surface level, it's strong enough to support traffic applications and standard construction equipment — all with minimal cover.

MARINO CELL

The Marino Cell is designed with field adaptability in mind: Craft the right chamber size for your project by selecting the system's depth (up to four cells high) and its footprint (the cells are modular for simple install and size customization).
